## **REPORT**

**CT Thorax abdo & pelvis with contrast:** (reported 09-Jul-2025)

Comparison with previous from 5/3/25.

There is a right-sided port in situ with tip in the SVC.

The multiple areas of opacification in both lungs are similar, if not slightly smaller to previously. The previously seen nodule in the middle lobe has almost entirely resolved. No definite new lung nodules identified.

There has been a reduction in size of the previously seen right hilar and mediastinal lymph nodes, for example right hilar node has reduced in size from 24 mm to approximately 10 mm and a subcarinal node has reduced from 42 x 26 mm to 28 x 13 mm.

Previous liver resection noted.

No new abnormality identified within the liver. Previous cholecystectomy. Normal pancreas, spleen, adrenals, kidneys and urinary bladder.

Previous colonic resection noted. Anastomosis appears clear. The residual bowel is unremarkable.

No convincing peritoneal nodules.

Previous left anterior rib fracture noted.

No new destructive skeletal lesions.

### Conclusion:

There has been a good partial response to treatment of the mediastinal and right hilar nodes. The right middle lobe nodule has resolved. Otherwise stable appearance in the lungs. No new or progressive disease identified.
